Payday is a decision most people skip.

If you're paid in USDC, every payday asks how much stays as cash and how much gets invested. Acting on it means a wallet, a DEX, your own price checks, and hoping you sign the price you meant.

So the money just sits there.

Audience: USDC-paid freelancers and contractors. A hypothesis, not yet validated with interviews.

THE PRODUCT

Oink: get paid in stocks, on your phone.

Payment link / @tag → Verified on-chain → Cash reserve first → Stock orders →

Bell check → you sign

OINK · ACCOUNT

No seed phrase

Password + authenticator open an encrypted wallet in your browser. @tags, payment links, Mix.

FLOW · PLAN

Reserve first

Referenced USDC intake, finalized receipt check, exact BigInt split into SPYx / NVDAx / AAPLx orders.

BELL · SAFETY

Checked before signing

Jupiter quote vs. your limits. Fails closed: deferred orders stay in USDC.

HOW BELL PROTECTS YOU

Nothing is bought until you sign, and only if it passes.

Before the quote reaches you

- Exact-amount Jupiter Swap v2 route, 30-second expiry
- Slippage, price-impact and maximum-price limits
- Premium cap over the Pyth stock price, after the xStock's on-chain share multiplier, only with fresh regular-session data

Before and after you sign

- Instruction allowlist, decoded route, you as the only signer, simulation
- Signed locally: the server never holds your key
- Saved before broadcast; uncertain outcomes are reconciled, never resent

Pass → review and sign. **Defer** → your USDC stays put. Bell never invents a price.

DEMO · UNDER 3 MINUTES, ON A PHONE

One payday, start to finish.

Sign up → Set plan & Mix → Client pays from Seeker → Reserve fills

SPYx passes · AAPLx deferred → Sign locally → Confirmed on Solscan

Video: [demo video link] · Live app: oinkwallet.vercel.app · APK: [link]

Any part not recorded on mainnet is shown in the labelled simulation at /demo.

PROOF

Built and tested end to end.

125
unit tests passing: allocation, Bell policy and premium math, guards, MWA, journey

64
PostgreSQL integration tests: receipts, idempotent allocation, persist-before-broadcast, push, SKR quota

1
signer on every Bell trade: you. No server key, sponsorship or delegation, enforced and tested

Verified live (read-only): Jupiter routes for SPYx/AAPLx/NVDAx; xStock Token-2022 multipliers (1.0017–1.0057, not 1:1); SKR mint.

First mainnet fill: [Solscan link: pending]
Users / revenue: none claimed yet.

BUSINESS MODEL · TO VALIDATE

Every payday brings you back.

Wedge

USDC-paid freelancers and contractors who already want a reserve plus stock exposure.

Distribution

Payment links put Oink in front of every client who pays. Then platforms that pay contractors in USDC.

Revenue (hypothesis)

A small, disclosed fee on executed purchases (zero today by design), or a paid plan for payers running payroll links.

Next proof point: a consented pilot of 3–5 freelancers, measuring repeat paydays, fills, costs and drop-off (`02–PILOT.md`).

Payday is a phone moment.

Mobile

- Installable app; Android APK for the Seeker and dApp Store
- Clients pay from their Seeker wallet (Mobile Wallet Adapter)
- Push when money lands or an order needs review
- SKR holders get more sponsored transfers

Solana

- Tokenized stocks (xStocks) and USDC on one chain
- Sub-cent network fees make $10 purchases sensible
- Solana Pay references make receipts verifiable
- Jupiter routing and Pyth reference prices compose in

Who we are and what's next.

Team

[Founder name, role, background, location]

[Why we understand USDC-paid workers]

Next 30 days

- Mainnet launch with eligibility gating (xStocks are not for US persons)
- Consented freelancer pilot
- Solana dApp Store listing
- Pyth key to enable premium caps by default
